

Abstract

Information element component of a signaling message

The invention is based on the object of permitting an operator to be able to introduce new services and/or service features into his network without them needing to have already been provided in advance in the software system of the exchanges by the manufacturer of the exchanges. This object is achieved by an information element of a signaling message which is designed such that the services or service features for which it is used can be stipulated during operation using an appropriate administration component.
